(APIs)
Student 3 (QA &

| Company Profile

Sharadha Stores is a traditional home-based food enterprise focused on high-quality, authentic South Indian delicacies.

-  **Traditional Range:** Handcrafted podis, pickles, appalam, ghee, and snacks.
-  **Distribution Channels:** Direct doorstep deliveries, local platforms, and high-volume WhatsApp channels.
-  **Loyalty Engine:** High customer retention built strictly around uncompromised home-style taste and premium quality.

| The Operational Gap

Manual Planning

All core capacities, production batch calendars, and ingredient procurement sequences are logged completely manually.

Fragmented Data

Critical business records and operational histories are scattered across disparate WhatsApp chats, phone logs, and notebooks.

Zero Live Visibility

Lack of central databases leaves teams blind to bottlenecks, wasting time on manual tracking rather than on preparation.

| Problem Statement

"Sharadha Stores lacks a dedicated digital system to systematically map expected festive order volumes against raw material procurement timelines and kitchen capacity constraints."

The Impact: This fragmented flow creates slow, error-prone scheduling, resulting in peak holiday stockouts, delayed fulfillment, and irreversible loss of seasonal market share.

| Project Objectives

Frontend Targets

Student 1: Design a validation-guarded Planning Entry Form paired with a search-friendly, multi-column filtering dashboard.

Backend Targets

Student 2: Implement standard RESTful API routes (CRUD) integrated with a Capacity and Utilisation Tracking Engine.

Quality & Deploy

Student 3: Configure modern pipelines and design a robust spreadsheet tracking all edges

| Project Abstract

This prototype delivers an intuitive, scale-ready digital scheduling companion customized for home-scale food enterprises.

The solution transitions operations from paper logs to a database that calculates exactly when to purchase raw materials and how to allocate daily stove/kitchen batch capacity.

Outcome: Flag constraints early and eliminate manual loss.

| Proposed Tech Stack

Frontend	React.js (HTML5, CSS3, ES6)	Renders Entry Forms, Live Status Dashboards, and History panel	
Backend	Node.js (Express)	Powers seasonal API routing and calculates business rule feasibility	
Database	PostgreSQL	Stores planning metadata, inventory status, and historical order	
Analytics	Recharts / Chart.js	Visually projects capacity limits and demand patterns in real-time	

|Planned UI Design

1. Entry Form

Captures target variables: production limits, batches, and seasonal festival windows.

3. Admin Config Panel

A control center to adjust operational parameters, batch constraints, and trigger levels.

2. Dashboards

A live central workspace showing statuses, filters, and immediate

4. Audit & Analytics

Track audit logs, historical trends, and dynamic chart visualizations

| Week 1 Accomplishments

- ✔ **Git Repository Configured:** Active hosted code repository featuring clean folder structure (`/frontend``, `/backend``, `/docs``, `/tests``).
- ✔ **Core Documentation Complete:** Drafted, aligned, and finalized standard project parameters and structural schema designs.
- ✔ **Environment Configuration:** All workstations activated locally with runtime environments and verification databases.

- ✔ **Baseline APIs Active:** Developed and tested `/health`` endpoint returning immediate success responses.
- ✔ **Initial QA Tracking:** Drafted a sheet detailing 15 discovery verification cases spanning standard and boundary

| Future Roadmap

Questions & Answers

Review 1 Milestone Completed – Ready for Mentor Feedback

Development of a Seasonal Production Planning Calendar for Sharadha Stores
